

## Thank you for purchasing a Krivo Pickup for Gypsy Jazz Guitar

To install your pickup follow these easy instructions :  
Take two small BB or lentil sized pieces of the included putty and apply one piece to each end of your pickup as shown in the photo below.

Flatten the putty with your thumbs till it is very thin, It takes VERY LITTLE putty to solidly affix the pickup to the Guitar. If you use too much it makes a mess and increases the height of the pickup which can interfere with your playing technique and make the strings hit the top of the pickup.

To align your new pickup simply press the pickup to top of guitar, making sure to that the magnetic pole-pieces lie directly underneath all six strings (as in fig. 3).

To adjust the volume of a particular string, use the included hex wrench: loosen the pole to increase the volume of a string, tighten to decrease the volume of a string. (The closer a pole is to a string the more volume is produced).

Finally, simply plug the attached 1/4" cable in to your amplifier and you are ready to play. Placing the pickup close to the fretboard results in a warmer sound, while a placement closer to the bridge results in a brighter sound. Experiment to see which placement you prefer.

Thank you for your business, be sure to check out our facebook page at: <https://www.facebook.com/KrivoPickups>
