

## Thank you for purchasing a Krivo Pickup for Gypsy Jazz Guitar

To install your pickup follow these easy instructions :  
Take two small BB or lentil sized pieces of the included putty and apply one piece to each end of your pickup as shown in the photo below.

Flatten the putty with your thumbs till it is very thin, It takes VERY LITTLE putty to solidly affix the pickup to the Guitar. If you use too much it makes a mess and increases the height of the pickup which can interfere with your playing technique and make the strings hit the top of the pickup.

The Krivo Nuevo pickup has a magnetic gap under the "B" string in order to provide optimal string to string balance.

To align your new pickup simply press the pickup to top of guitar, making sure to that the inlaid dot lies directly underneath the 'b' string (as in fig. 3).

Finally, simply plug the attached 1/4" cable in to your amplifier and you are ready to play.

Placing the pickup close to the fretboard results in a warmer sound, while a placement closer to the bridge results in a brighter sound. Experiment to see which placement you prefer.

Thank you for your business,
